The "Hot Fill"
Standard!

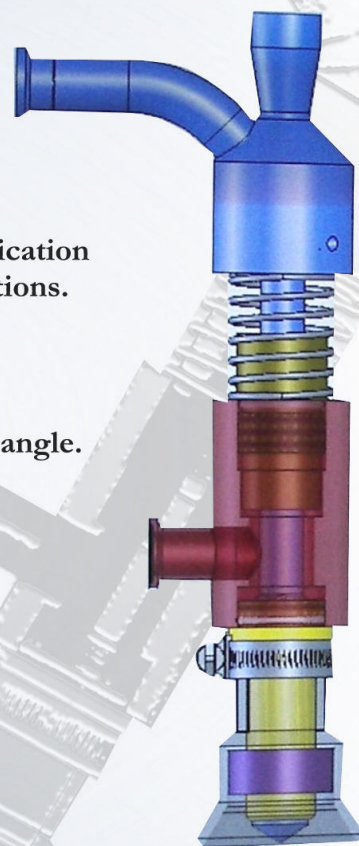

Bi-Flow Capable
(option)

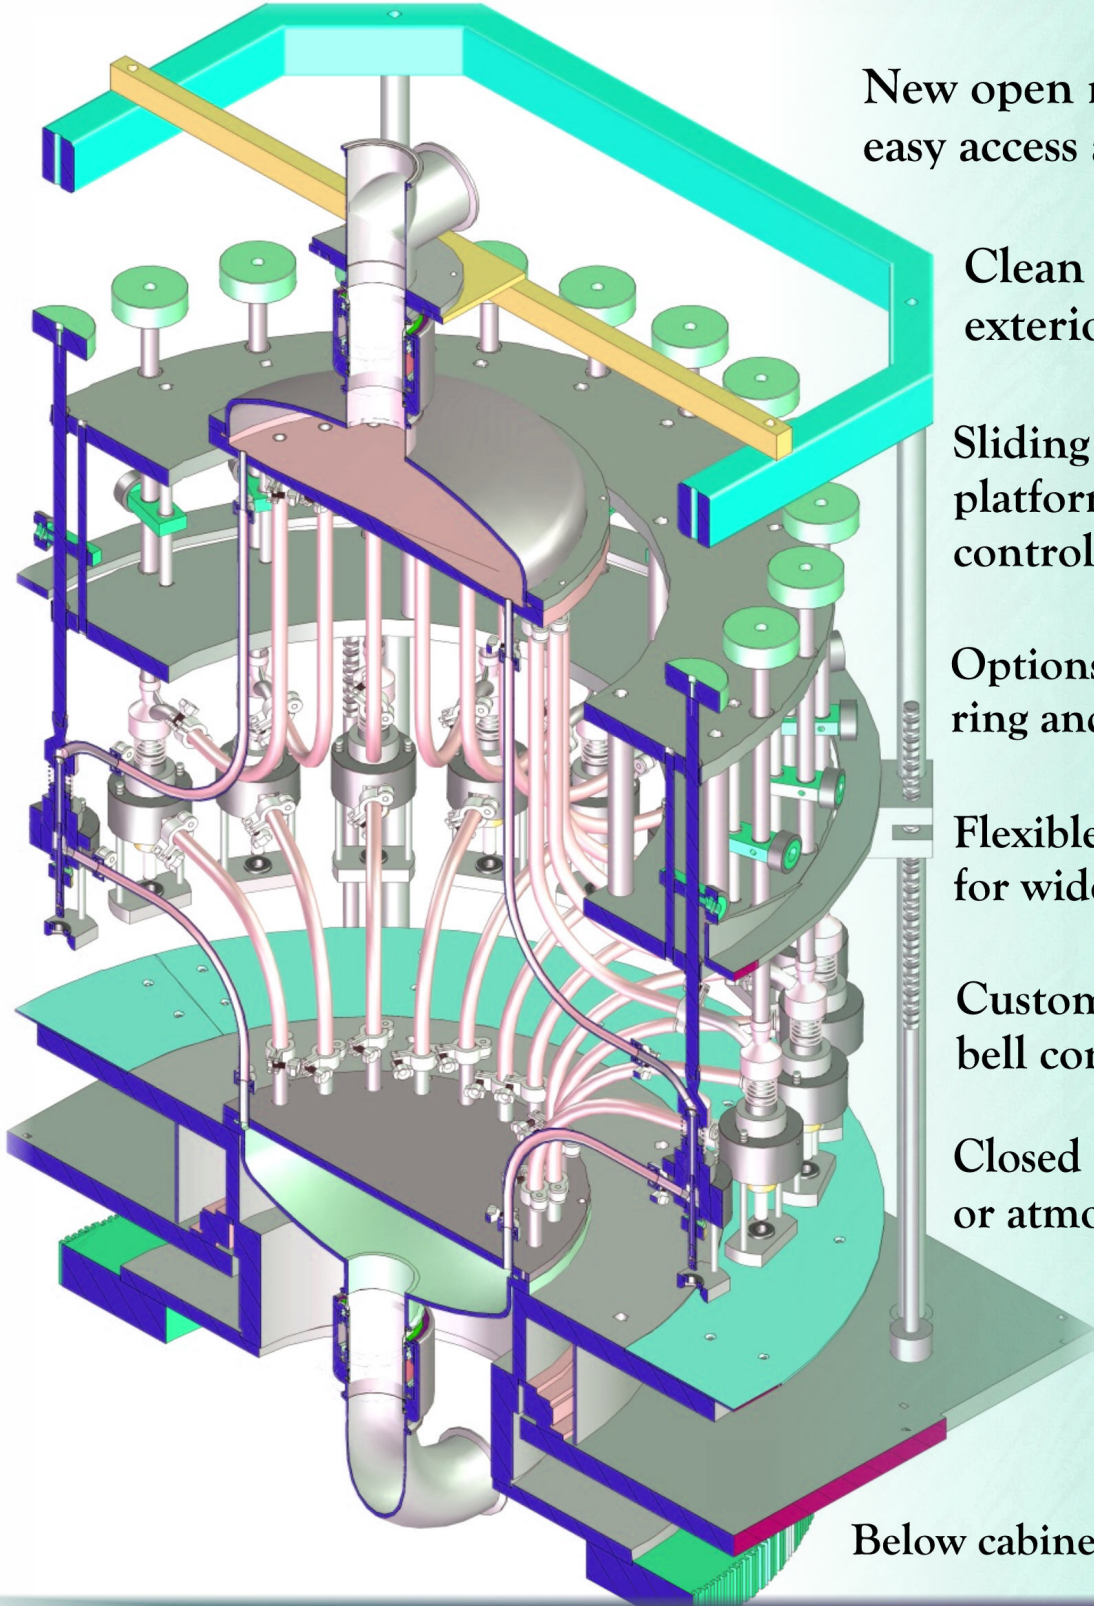

Discover why customers
always say that
a USB machine is

"Built like a tank"

Simplicity and Reliability

- Fill to level, with controlled repeatable accuracy. Ideally +/- 1/32". (assuming below brim fill)
- High speed capability with superior quality and robust construction. No sheet metal siding.
- Corrosive resistant design with stainless steel structural options. Only 316 SS liquid metal components - not 303.
- Recirculation or reprocessing liquid system configurations available. 1, 2, or no external tanks.
- Minimal preheat required, as well as limited product waste; due to tank-less bowl design.
- O-ringless tip designs and zero metal to metal contact features on many size valves.
- Foaming and non-foaming application capability. Including bleach options. PVC/Titanium flexibility.
- No bottle lifting platforms for more heads filling in a given angle. Bottle control never sacrificed.
- Reduced overflow "Bi-flow" option, if required, on larger machines.
- Total fill pressure control and shutoff plate for lightweight containers. Hot fill or cold fill.

New open roof design for easy access and more visibility.

Clean design - interior and exterior focus.

Sliding valves versus rising platforms - means better bottle control and larger filling angle.

Options for all SS ring and plate construction.

Flexible hosing allows for wide bottle ranges.

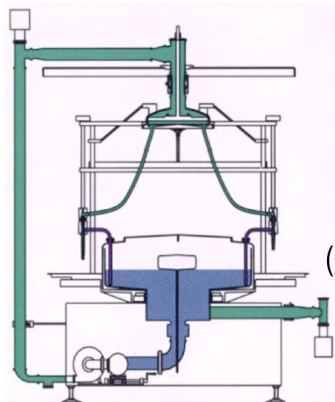

Custom valve and bell configurations.

Closed manifold design or atmospheric tank capability.

Thickest plates in the industry.
Maintains integrity over decades of use.

Below cabinet gear mount.

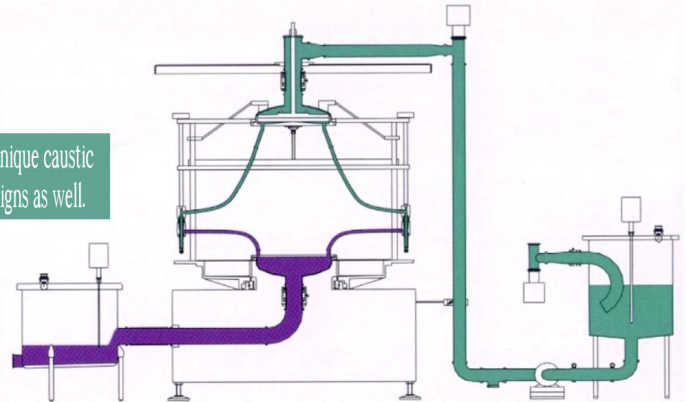

Available in recirculating or reprocessing style liquid systems.

(left) - Recirculating systems are popular for liquor, water, sauces, and industrial fluids applications.

Available in unique caustic resistant designs as well.

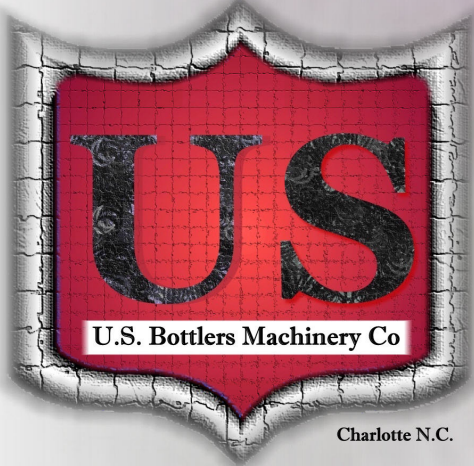

(right) - Reprocessing systems are often found in the juice, pharmaceutical, detergent, and hot fill industries.
